Rochester, NY

Re: Quality Engineer Intern (Job ID 41262)

Dear Hiring Manager,

I am applying for the Quality Engineer Intern role in Rochester. I study Biomedical Engineering at Cal Poly, I am a former West Point cadet, and I hold an inactive DoD Secret clearance that stays eligible for reactivation through January 2028. I have also spent three summers doing the core of what your posting describes: inspecting work, documenting nonconformances, and making sure defects get fixed before the customer signs off.

As a Quality Control Supervisor at Quality Windows, I inspected more than 30 residential and commercial properties each season against client requirements. When a job fell short, I wrote down the problem, directed the rework, and held sign-off until the rework was done. I also trained three employees on safety procedures and equipment use. Those summers taught me that a defect caught on site costs far less than one the customer finds.

I have kept building on that work. At Coastal Shine, the exterior cleaning business I started in March, I wrote the standard operating procedures for job setup, cleaning, and final inspection, and I prepare the cost estimate for every job. At MeldMD, I cleaned and validated a 3,050-record database and verified contacts for 98% of it, which takes the same care as an inspection log. On Cal Poly's EMPOWER design team, I turn user needs into written design requirements and test 3D-printed prototypes. I also build part models, assemblies, and engineering drawings in SolidWorks.

I want to learn how a Material Review Board, root cause analysis, and a Zero Defect program run on a real production line, and L3Harris would let me do that on hardware that supports national security. I am available from mid-June 2027, after Cal Poly's spring quarter ends, and I am ready to relocate to Rochester. Thank you for your time. I would welcome the chance to talk about how I can support your Quality team.

Sincerely,

Charles Morrisey
